Analysis of Popularity Trends

 A significant number of movies exhibit a huge contrast between their popularity scores and voter ratings. Despite having high popularity, many of these films fail to get favorable reviews from audiences.

 Based on the data set, voter ratings show how satisfied the audience is. Due to promotion, a film may be seen by many people, yet if it falls short of expectations, it may still obtain low ratings. Example: Smile(2022) has a high popularity average but the voter average turned out to be a 5.4

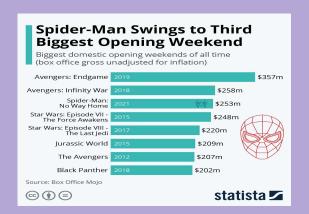

Analysis of Genre Trends

 The analysis shows that action and adventure genres tend to receive higher ratings. In contrast, horror and comedy often struggles with ratings despite sometimes being popular.

 Action movies typically have big budgets, star-studded casts, and extensive marketing campaigns, which contribute to higher popularity scores. This genre attracts a much bigger and diverse audiences while also generating a huge box office

 Despite some horror films becoming cultural icons and achieving significant box office success, they often receive lower average ratings. Horror movies are subjective so basically what scares one viewer might not scare another

Visualization used: Bar Graph

 Superhero, action, and adventure films often lead the box office but rarely win major awards like Best Picture. Popularity doesn't guarantee critical acclaim, as drama and biopic films, with stronger storytelling, tend to win more awards. It's even spotted in the datasets but instead of awards its voter averages.

Limitations In The Dataset

Lack of Global Context: Without international box office data, it's challenging
to assess how a movie performed in markets outside the U.S. This is
particularly important for films that may perform exceptionally well in certain
regions but have lower popularity or ratings elsewhere.

Techniques Used

Data Importing

```
[1]: import pandas as pd
[2]: df = pd.read_csv('top_popular_movies.csv')
[3]: df
```

Extracting Column Names

```
[10]: df.columns.tolist()
[10]: ['title', 'release_date', 'popularity', 'vote_average']
```

Duplicate Detection

```
duplicates_subset = df.duplicated(subset=['title'])
num_duplicates_subset = duplicates_subset.sum()
umber of duplicate rows based on 'title': {num_duplicates_subset}".
Number of duplicate rows based on 'title': 3
```

Essential for manipulating and analyzing the data efficiently

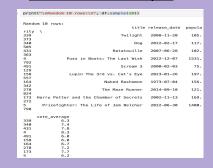

Subset Creation

```
umber of rows: {num_rows}, Cleaned number of rows: {new_num_rows}")
Original number of rows: 500, Cleaned number of rows: 497
```

Focuses on a subset of data that meets a certain criteria

Helps retrieve the names of all columns and changes it to a list format

Dataframe Sample

Identifies and removes duplicates which leads to better results

Helps better understand a variety of data points which can inform further analysis.

CONCLUSION

A movies popularity and genre strongly influence audience preferences. High ratings and critical admiration boost a movies appeal which can guide audiences toward high quality movies.
